## SOFTWARE ENGINEER

---

Full-stack product engineer with 8+ years shipping internal tools and knowledge platforms. Spent five years on the Genesys Knowledge organization building internal knowledge hubs, training infrastructure, and the developer community platform, usually as the sole engineer from problem intake through deploy. Now building LLM-native agent systems from scratch.

## SKILLS

---

**Languages:** JavaScript, TypeScript, Python, Java, SQL

**Frontend:** React, Angular, HTML/CSS, Node.js

**Cloud & Backend:** PostgreSQL, AWS Lambda, API Gateway, S3, Serverless Framework, REST API design

**Practices:** LLM application development, Git, CI/CD, Agile, Linux

## EXPERIENCE

---

**Genesys** — Software Engineer, Knowledge Team

Aug 2021 – Oct 2026 · Remote

- Built and shipped the Orchestrators site and the supporting knowledge resource library used across customer-facing training programs — internal knowledge hub work, owned end to end.
- Sole engineer on the Genesys Community platform for ~2 years — a surface used daily by thousands of members. Owned the full stack from feature design through production deploy.
- Worked directly with Knowledge team stakeholders to scope what to build, rather than receiving specs — translated their workflow problems into shipped product.
- Built workflow-automation features for the Knowledge team, then trained four engineers, including the incoming Community developer, on them — handing off ownership cleanly rather than leaving a single point of failure.
- Provisioned and maintained cloud VM environments for hands-on course training behind a catalog of thousands of courses in daily use, giving instructors reproducible lab setups instead of manual per-session builds.
- Shifted to backend service work in the final year: API and data-layer development on AWS serverless (Python and TypeScript Lambdas) supporting Knowledge team products.

**FIS** — Junior Software Engineer

Jun 2018 – Jul 2021 · Tampa, FL

- Developed global retail payments features in Angular, Python, Java, and C++ on Linux.
- Built a PCI data-scrubbing utility that kept cardholder data out of non-production environments.
- Led an Angular GUI revamp of a core internal tool; contributed to code reviews, test plans, and regression testing.
- Started as a Global Retail Payments intern (Summer 2017) and converted to full time.

## PROJECTS

---

**Round Table — an LLM agent fleet built on OpenClaw** (2025 – present). OpenClaw is an open-source agent gateway; Round Table is the layer I designed and wrote on top of it and run against real daily workloads: specialized LLM agents with message routing, a shared task board, scheduled automation, a production deploy lock, and an evidence-gated handoff protocol. 0 → 1, solo, in production against my own daily work.

## EDUCATION

---

**B.S. Cybersecurity** — University of South Florida

2020
