SOFTWARE ENGINEER

Full-stack engineer with 8+ years building web platforms and developer-facing tools on AWS serverless. Owned the Genesys Community platform end to end as its primary developer — TypeScript and Python across Angular, React, and Lambda — then moved deeper into backend service work. Known for taking sole ownership of a product surface and training the engineers who inherit it.

SKILLS

Languages: TypeScript, JavaScript, Python, Java, SQL, C#

Frontend: React, Angular, HTML/CSS, Node.js

Cloud & Backend: AWS Lambda, API Gateway, S3, Serverless Framework, REST API design, cloud VM provisioning

Practices: Git, CI/CD, code & test review, regression testing, Agile, Linux

EXPERIENCE

Genesys — Software Engineer, Knowledge Team

Aug 2021 – Oct 2026 · Remote

- Primary developer for the Genesys Community platform for ~2 years — a surface used daily by thousands of members, where I was the sole engineer owning the full stack from feature design through production deploy.
- Built and shipped the Orchestrators site and the supporting knowledge resource library used across customer-facing training programs.
- Built workflow-automation features for the Knowledge team, then trained four engineers, including the incoming Community developer, on them — handing off ownership cleanly rather than leaving a single point of failure.
- Provisioned and maintained cloud VM environments for hands-on course training behind a catalog of thousands of courses in daily use, giving instructors reproducible lab setups instead of manual per-session builds.
- Shifted to backend service work in the final year: API and data-layer development on AWS serverless (Python and TypeScript Lambdas) supporting Knowledge team products.

FIS — Junior Software Engineer

Jun 2018 – Jul 2021 · Tampa, FL

- Developed global retail payments features in Angular, Python, Java, and C++ on Linux.
- Built a PCI data-scrubbing utility that kept cardholder data out of non-production environments.
- Led an Angular GUI revamp of a core internal tool; contributed to code reviews, test plans, and regression testing.
- Started as a Global Retail Payments intern (Summer 2017) and converted to full time.

PROJECTS

Round Table — an agent fleet built on OpenClaw (2025 – present). OpenClaw is an open-source agent gateway; Round Table is the layer I designed and wrote on top of it and run against real daily workloads: a fleet of specialized LLM agents with message routing across Discord and other channels, a shared task board with claim/dispatch rules, scheduled automation, a production deploy lock, and a confidence-scored, evidence-gated handoff protocol with a blind-verifier gate. TypeScript, Python, Node.js, SQLite, systemd.

EDUCATION

B.S. Cybersecurity — University of South Florida

2020
